

# STEELGUARD 65™

*Premium Cool Weather* Asphalt Sealer

**Built Tough for the  
Cooler Environments**

# STEELGUARD 65™

**SteelGuard 65** is a sealcoat product specifically designed by RaynGuard that is readily applied to pavement surfaces in cooler climates. The dynamics of the active materials in **SteelGuard 65** contribute to having a reliable product that effectively dries quickly than many other sealcoat materials in cooler weather.

*How can **SteelGuard 65** help you in poor weather?*

Sealcoat construction is all about drying. Every product is designed to use water as a carrying agent to bring a coating of asphalt to protect a pavement surface. During hot summer weather temperatures nearly all products dry quickly, but in cooler times of the year, **SteelGuard** and especially **SteelGuard 65** dry quickly, often much quicker than other materials.

With **SteelGuard 65** it takes less material to produce better results. **SteelGuard 65** is 65% solids. Do the math—one coat of **SteelGuard 65** gives your customer more material than two coats of the typical asphalt sealer—for less money.

At **RaynGuard** we strive to provide only the best available materials for our customers. For our sealcoat customers we offer our **SteelGuard** range of asphalt sealers that are the toughest, longest lasting sealcoat material available.

**SteelGuard 65** has 65% solids which means that it dries faster the normal sealcoat and dries thicker!
